

**In the Claims:**

Please cancel claims 25 and 37-38 without prejudice or disclaimer of the subject matter contained therein and amend the claims as follows:

Sub B1  
Q1  
1. (Amended) A delivery device for treatment of erectile dysfunction in a patient, [comprising] consisting of a single layer [disk formed from] of a filmogenic polymer, [and having] wherein the single layer of filmogenic polymer comprises an effective dose of a therapeutic agent suitable for [reversing] treating erectile dysfunction.

2. (Amended) A delivery device according to claim 1, comprising further at least one additive contained within the single layer of filmogenic polymer [the disk], wherein the at least one additive is selected from the group consisting of a stabilizer, a solubilizer, an enhancer and a plasticizer.

Q2  
8. (Amended) A delivery device according to claim 2, wherein the enhancer is at least one selected from the group consisting of a glycolipid, a non-esterified fatty acid, an aliphatic alcohol, a fatty acid ester of an aliphatic alcohol, a cyclohexanol, [a cyclohexanol derivative,] a fatty acid ester of glycerol, a glycol, an aliphatic alcohol ether of a glycol, and a surfactant.

Q3  
9. (Amended) A delivery device according to claim 8, wherein the filmogenic polymer is polyvinyl pyrrolidone, the therapeutic agent is prostaglandin E1, the enhancer is [Eutanol G16S] hexyldecyl stearate, and the plasticizer is PEG 400.

12. (Amended) A delivery device according to claim 9, having polyvinyl pyrrolidone present in an amount that is 40 to 45%, having prostaglandin E1 present in an amount that is 5 to 10%, having [Eutanol G16S] hexyldecyl stearate present in an amount that is 1 to 4%, and having PEG 400 present in an amount that is 40 to 50%.

A4 17. (Amended) A delivery device according to claim 2, having a plasticizer in an amount less than 30% on a dry weight basis [and forming a rigid disk].

A5 21. (Amended) A method of treating erectile dysfunction, comprising:  
selecting [a disk formed from] a device consisting of a filmogenic polymer and comprising one or more therapeutic agents suitable for treating erectile dysfunction [selected from the group consisting of a vasodilator, a smooth muscle relaxant, an anti-depressant, a parasympathetic stimulator, a renin-angiotensin system inhibitor, a local anesthetic, an  $\alpha$ -blocker, and a calcium channel blocker]; and  
placing the device in contact with a penile surface delivering the therapeutic agent to the penile surface over an effective period of time.
